

The possible actions a user can take on a page are illustrated as either links, buttons, or forms.

Each page shows the user actions that are possible on it. Each user action is correlated to a wireframe that displays the elements (e.g. a button, a form, or a link) that permit the user action.

The interaction flow provides an overview of the actions a user can take on each page, and the consequences of each user action. An interaction flow can show one or more flows. For readability, it is recommended that only one interaction flow be diagrammed per page.

An interaction flow captures the system responses to user actions.

User Actions User role/type: Site visitor
1 The user selects a link to view content that can be viewed by all users of the system.

System Actions System name: Web-based System
1 The system determines if user credentials are required to view the page. As the page is a public page, establishing the identity of the user, or the user's credentials, are not required. The system allows the user to view the page, and displays the page to the user.

Notes
Users will be able to view pages managed by the system. Pages will either contain content that will be visible to all users (public content), and content that will be visible only to users with the sufficient credentials (restricted content). If a user makes a request to view a page, the system will first validate if the page has public or restricted content. If the page has only public content, it will display the requested page to the user. If the page has any restricted content, the system will determine if the user has sufficient credentials to view the requested content. If it cannot be determined who the user is, the system will display a page where the user can either sign-in to the system or register with the system.

Note: This page provides all the necessary elements to create a page interaction model, and provides a partial example.

This template uses the Calibri font.

The page setup of this template:
Page Size: A3, Page Layout: Landscape

Download either the free Microsoft Powerpoint 2007 Viewer or the Microsoft Office Compatibility pack to obtain the Calibri font.
